

ABSTRACT OF THE DISCLOSURE

A paper processing apparatus feeds papers one by one from the first cassette for storing papers to be delivered to the outside, conveys the fed papers on the first conveyance path to store them in a predetermined temporary storing section, and then delivers the stored papers in a block through a paper delivery aperture to the outside. Also, the paper processing apparatus leads papers having difficulties with delivery after being fed from the first cassette, to the second conveyance path which is a divergent path of the first conveyance path, and stores the led papers in the second cassette. The paper processing apparatus further comprises the third conveyance path for receiving papers coming from the outside and transmitting them to the first conveyance path.
